

Core Builds

SEL Expression Layer

Custom AIOStreams expressions built on top of the Tam-Taro SEL baseline

Expressions	In Trial	Planned	Tam-Taro Gap
7	4	3	100%

■ ESE — Excluded Stream
Expression

■ ISE — Included Stream
Expression

■ PSE — Preferred Stream
Expression

● Trial ■ Planned

1	REPACK / PROPER Passthrough	ISE	● TRIAL
---	-----------------------------	-----	---------

Pins REPACK and PROPER releases to the head of the result queue, bypassing the excluded and limit pipeline stages. Ensures patched releases always surface even when downstream ESEs would otherwise suppress them. Only activates when at least one REPACK/PROPER exists in the non-library, non-SeaDex pool.

Expression

```
/*REPACK/PROPER Passthrough*/
count(
keyword(negate(merge(library(streams),seadex(streams)),streams),'all','repack','proper')
)>0
? passthrough(
keyword(negate(merge(library(streams),seadex(streams)),streams),'all','repack','proper'),
'excluded','limit'
)
: []
```

Template Use Cases

Template	Impact	Notes
All templates	Universal	REPACKs fix broken encodes and corrupt audio — relevant across every template type.
Anime · all variants	Critical	Fansub REPACKs are extremely common; a v2 or REPACK may be the only watchable version of an episode.
Hybrid · 4K Hybrid	High	Scene/Usenet REPACK cycles happen frequently on new releases; catching them early matters on Usenet-heavy builds.
Stream · Essential	High	1080p WEB-DL REPACKs from streaming services (Netflix/AMZN fix runs) are common in the first 24h after release.

2	Per-Addon Flood Guard	ESE	● TRIAL
---	-----------------------	-----	---------

Caps the number of results contributed by each scraper addon on cached non-library streams. Prevents high-volume addons (Meteor, Comet) from flooding the result list and burying quality results from lower-volume sources. Caps: Meteor ≤5, Comet RD ≤5, MediaFusion ≤4, Torrent Galaxy / EZTV / Knaben / HdHub ≤3.

Expression

```
/*Per-Addon Flood Guard*/
merge(
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)),'Meteor'),5),
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)),'Comet RD'),5),
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)),'MediaFusion'),4),
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)),'Torrent Galaxy'),3),
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)),'EZTV'),3),
```

```
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)), 'Knaben'),3),
slice(addon(negate(merge(library(streams),seadex(streams)),cached(streams)), 'HdHub'),3)
)
```

Template Use Cases

Template	Impact	Notes
Stream · Essential · FireStick	Critical	Meteor returns 15–20+ 1080p results; without caps the top 15 slots are all Meteor, drowning out Comet and TorBox-native results.
Apex · 4K Apex · 4K Essential	High	4K results from Meteor can outnumber curated Comet/MediaFusion results 5:1 on popular titles.
Anime · all variants	High	AnimeTosho and HdHub can flood with low-quality upscales; per-addon caps keep quality releases visible.
Hybrid · 4K Hybrid	High	Usenet + debrid stacks generate more total results; flood guard prevents any single source type dominating.
Speed · Flash	Moderate	These templates already bias toward cached instant results; guard prevents cache-flooding from Meteor on speed-focused configs.

3

Usenet Propagation Guard

ESE

● TRIAL

Holds back Usenet NZBs younger than 2 hours (0.083 days) when fully propagated NZBs already exist. Eliminates incomplete or corrupt early-propagation grabs that appear immediately after a scene release hits indexers. Only activates when there are propagated alternatives — if all Usenet results are <2h old the guard does not fire, preserving availability on fresh content.

Expression

```
/*Usenet Propagation Guard*/
count(
  negate(
    age(type(streams, 'usenet', 'stremio-usenet'),0, '0.083'),
    type(streams, 'usenet', 'stremio-usenet')
  )
)>0
? age(type(streams, 'usenet', 'stremio-usenet'),0, '0.083')
: []
```

Template Use Cases

Template	Impact	Notes
Apex · 4K Hybrid · 4K Essential	Critical	4K Usenet releases on NZBGeek/TorBox Usenet are grabbed within minutes of scene drop; corrupt early NZBs are a top complaint for 4K Usenet builds.
Hybrid · 1080p variants	Critical	Hybrid stacks Usenet + debrid; young NZBs arrive before binary propagation is complete and can stall playback.
Stream · Essential	High	TorBox's native Usenet scraper surfaces new NZBs fast; propagation guard prevents the first-grabbed-but-incomplete result appearing at the top.
Speed EasyNews · Speed Plus	High	EasyNews returns results immediately; propagation guard catches the window between indexer post and full server propagation.
Flash · Flash 4K	Not applicable	Flash templates use only cached debrid content; no Usenet scraper active.

4

Codec Efficiency Booster

PSE

● TRIAL

Surfaces HEVC (H.265) and AV1 encodes of Bluray REMUX and WEB-DL/WEBRip content ahead of AVC (H.264) equivalents at 1080p and 720p. Delivers 30–50% lower bandwidth at identical perceptual quality. Applied only to the non-library, non-SeaDex cached pool — library and SeaDex results are never reordered.

Expression

```
/*Codec Efficiency Booster*/
merge(
  encode(resolution(quality(negate(merge(library(streams),seadex(streams)),cached(streams))),'Bluray
  REMUX'),'1080p'),'HEVC','AV1'),
  encode(resolution(quality(negate(merge(library(streams),seadex(streams)),cached(streams))),'WEB-DL','WEBRi
  p'),'1080p'),'HEVC','AV1'),
  encode(resolution(quality(negate(merge(library(streams),seadex(streams)),cached(streams))),'Bluray
  REMUX'),'720p'),'HEVC','AV1'),
  encode(resolution(quality(negate(merge(library(streams),seadex(streams)),cached(streams))),'WEB-DL','WEBRi
  p'),'720p'),'HEVC','AV1')
)
```

Template Use Cases

Template	Impact	Notes
Stream · Stream Lite · FireStick variants	Critical	Primary 1080p WEB-DL template; HEVC WEB-DL is up to 40% smaller than AVC at the same quality — directly impacts FireStick and bandwidth-constrained users.
Essential · Essential Lite	Critical	Essential users often run cheaper hardware or mobile connections; HEVC/AV1 efficiency is the main benefit for this audience.
Anime · Anime Lite · Anime Dub	High	HEVC is effectively the standard codec in fansub releases; booster ensures fansub HEVC results surface above any AVC encode alternatives.
Speed · Speed Lite variants	Moderate	Speed templates already bias toward cached results; booster adds codec preference on top of that without disrupting cache-first ordering.
Apex · 4K Apex · 4K Hybrid	Low	4K REMUX content is almost exclusively HEVC already; minimal effect. DV/HDR encodes at 4K are nearly always HEVC by definition.
Flash · Flash 4K	Not applicable	Flash prioritises instant-play speed over codec; codec reordering would conflict with the Flash philosophy.

5	Audio Pinnacle	PSE	■ PLANNED
---	----------------	-----	-----------

Promotes lossless and object-based audio tracks to the top of the ranked pool. Ordered by priority: Atmos / TrueHD (highest) → DTS-HD MA / DTS-X → EAC3 / DD+. Applied only to non-library, non-SeaDex cached streams — library and SeaDex results remain untouched. Tam-Taro has zero audio preference expressions; this fills the gap entirely.

Expression

```
/*Audio Pinnacle*/
merge(
  audioTag(negate(merge(library(streams),seadex(streams)),cached(streams)),'Atmos','TrueHD'),
  audioTag(negate(merge(library(streams),seadex(streams)),cached(streams)),'DTS-HD MA','DTS-X'),
  audioTag(negate(merge(library(streams),seadex(streams)),cached(streams)),'EAC3','DD+')
)
```

Template Use Cases

Template	Impact	Notes
Apex · 4K Apex (TorBox)	Critical	Flagship 4K template — users running home theatre setups with receivers and soundbars. Atmos / TrueHD is a primary reason to choose REMUX. Without this, an SDR WEB-DL with Atmos can rank below a DV REMUX with AAC.
4K Hybrid · 4K Essential	Critical	Same audience as Apex; Usenet and debrid 4K results frequently differ in audio track — guard surfaces the better audio option automatically.
Hybrid (1080p)	High	1080p Bluray REMUX with TrueHD is meaningfully better than AVC/AAC for users with audio equipment; Hybrid is the template most likely to have these options.
Stream · Stream FireStick	Moderate	Atmos EAC3 exists on 1080p WEB-DL (Disney+, Apple TV+, Netflix). Relevant for Dolby-capable soundbars even on streaming devices.
Essential · Essential Lite	Moderate	Usenet + TorBox Essential stack often includes lossless audio on 1080p REMUX results; surfacing them correctly improves the experience for Essential subscribers with audio hardware.

Speed variants	Low	Speed-focused build; audio preference is secondary to cache speed. Safe to include but limited practical impact.
Anime · all variants	Low	Anime fansubs use FLAC or AAC almost exclusively; Atmos/TrueHD are rare. SeaDex results (already pinned) have the best audio; this expression has minimal effect on anime queries.
Flash · Flash 4K	Not applicable	Instant-play philosophy; audio selection is irrelevant to the Flash use case.

6	HDR / DV Priority	PSE	■ PLANNED
---	-------------------	-----	-----------

Within 4K results, surfaces Dolby Vision and HDR variants ahead of SDR equivalents. Ordered by priority: DV / HDR10+ / HDR10+DV (highest) → HDR10 / HDR → SDR (falls through to Tam-Taro ranking). Tam-Taro's cache tier PSEs treat all visual tags equally; this adds the missing HDR layer on top. On 1080p-only templates the expression evaluates to an empty 2160p pool and has zero effect — safe to deploy universally.

Expression

```
/*HDR/DV Priority*/
merge(
  visualTag(
    resolution(cached(negate(merge(library(streams),seadex(streams))),streams)), '2160p'),
    'DV', 'HDR10+', 'HDR10+/DV'
  ),
  visualTag(
    resolution(cached(negate(merge(library(streams),seadex(streams))),streams)), '2160p'),
    'HDR10', 'HDR'
  )
)
```

Template Use Cases

Template	Impact	Notes
Apex · 4K Apex (TorBox)	Critical	Core use case — DV REMUX and HDR10+ should always rank above SDR 4K Bluray. Without this a SDR WEB-DL can outscore a DV REMUX if Tam-Taro's tier ranking happens to favour it.
4K Essential	Critical	Essential 4K users target the best available quality within their debrid tier; HDR/DV ordering is a key part of that.
4K Hybrid	Critical	Hybrid pulls from both Usenet and debrid; HDR/DV results from different sources need consistent ordering regardless of origin.
Flash 4K	High	4K Flash is cached-only; among cached 4K results DV should surface above SDR for devices that support it.
Speed 4K · Speed 4K Plus (EasyNews)	High	Speed 4K targets fast 4K cached results; among those results HDR/DV ordering matters.
Anime 4K	Moderate	Native 4K anime is rare; most 4K anime results are AI upscales or BD sources. HDR ordering still helps where real 4K HDR anime exists (e.g. recent theatrical releases).
Stream · Essential · FireStick · Anime (1080p)	No effect	These templates block 2160p resolution at the filter stage; the 2160p pool is empty so this expression returns [] — zero impact, zero risk.
Flash (1080p)	No effect	Standard Flash blocks 4K; expression has no effect.

7

AI Upscale Exclusion

ESE

■ PLANNED

Excludes streams whose filename or metadata contains AI upscaling keywords. Uses the ``keyword()`` function added in AIOStreams v2.29.6 (May 2026) — the first Core Builds expression to use this function. Targets: topaz, ai-upscale, aiupscale, upscaled, neural, enhancedai. Catches AI-processed releases that appear as native 4K but are soft and artefact-heavy. Inline (not synced) — works on every AIOStreams instance regardless of SEL_SYNC_ACCESS configuration.

Expression

```
/*AI Upscale Exclusion*/
keyword(
negate(merge(library(streams),seadex(streams)),streams),
'all',
'topaz','ai-upscale','aiupscale','upscaled','neural','enhancedai'
)
```

Template Use Cases

Template	Impact	Notes
Apex · 4K Apex (TorBox)	Critical	4K is the primary domain of AI upscaling; Topaz-processed 'UHD' releases appear legitimate until viewed. Critical for users paying for true 4K quality.
4K Essential · 4K Hybrid	Critical	Same reasoning — AI upscales pollute the 4K result pool and rank highly due to file size and resolution metadata matching genuine 4K.
Anime 4K	Critical	AI upscaling is endemic in anime; a huge proportion of indexer '4K' anime releases are Topaz upscales of 1080p BD sources. SeaDex helps but doesn't cover every title.
Anime · Anime Lite · Anime Dub	High	AI upscaled 1080p anime releases exist (upscaled from 720p BD). Fansub HEVC is almost never AI upscaled so this primarily catches encode releases.
Flash 4K	High	Cached 4K pool on Flash includes AI upscales; excluding them improves instant-play quality.
Speed 4K · Speed 4K Plus	High	Same cached 4K pool concern as Flash 4K.
Stream · Essential · FireStick	Moderate	AI upscaled 1080p is less common but growing; worth including as a precaution — false positives are near-zero since legitimate releases don't use these terms.
Flash (1080p)	Low	Cached 1080p pool; AI upscaling less prevalent at this resolution. Include for completeness.

All expressions are inline (not synced) — they work on every AIOStreams instance regardless of SEL_SYNC_ACCESS configuration. Expressions 1–4 are in active trial on Core Nexus Stream v2.7.10. Expressions 5–7 are planned additions pending trial completion.
